Subject: ASPECT mission report for 29 June 2011
Date: 06/29/2011 09:23 PM
Attachments: [Mission Report Flight 1 06-29-11.pdf](#)

Greg,

Please find attached the mission report for 29 June 2011. The White Rock and area east of highway 4 (Las Alamos East) was flown. No smoke was over these areas and no chemical detections were observed. Radiological data collected over the Las Alamos east area showed no abnormal detections. Radiological data over White Rock showed a statistical significant Cs-137 detection but the team feels that the detection is caused by rapid elevation changes. During flights on 30 June 2011 the same area will flown and compared to the observations on 29 June 2011.

All data and the report have been uploaded to the website.

We have fixed the IT issues and should not have future delays in getting out data.

Current plans are to re-fly the same areas that were flown today and hopefully we can fly the City of Las Alamos. If necessary we may fly as high as 15000 feet to get over the smoke. On subsequent surveys we may want to fly along the leading edge of the smoke.
